Cosc 4740 Program 1

Due Date: Feb 2

Goal: A programming warm-up exercise

Grade: 50 points.

Writing in C++ and it must be able to be compiled and run on the department linux systems.

QueueArray Class: To be used in Homework #2

Implement a variable sized generic **QueueArray** class that implements an array of queues, and exports the following functions:

- 1. *int* **Enqueue**(*type* item, *int* index): Enqueues *item* in the queue of array index *index*. Returns 1 if *item* is successfully enqueued; -1, if *index* is out of range; 0, otherwise
- 2. *type* **Dequeue**(): Dequeues an item from the first non-empty queue in the array, *i.e.*, from the non-empty queue at the lowest numbered index in the array. Returns the dequeued item, if there is at least one item in the queue array; 0 otherwise.
- 3. *int* **Qsize**(*int* index): Returns the number of items in the queue at array index *index*; -1, if index is out of range.
- 4. int Asize(): Returns the size of the array.
- 5. int QAsize(): Returns the total number of items stored in the array of queues.
- 6. *type** **Qstate**(*int* index): Copies all items stored in the queue at array index *index* in an array. Returns a pointer to this array; NULL, if index is out of range.

Implement the **QueueArray** class in such a way that an example **QueueArray** object *intqueue* consisting of an array of 10 integers queues may be constructed using the following statement:

QueueArray <int> intqueue (10); //c++ version.

Write or use my driver file for testing. When turning in the program and output, use the original driver file (changes for includes name is ok).

Turning in the Assignment:

Hard copy:

- 1. A cover page with Name, program #1, cosc 4740 a repo name (see github and below for your repo name).
- 2. Output of the driver.

Soft copy:

1. Use this link to create your repo https://classroom.github.com/a/r0M4W_a_

- 2. Upload the project to your repo
- 3. Edit the readme.md file, add the following:
 - o Name
 - O How to compile the code, if there is no makefile.
 - o List anything that doesn't work (that you know of)
- 4. Lastly ensure everything has uploaded to the github website and not just the local repo.

Code will be graded on correctness, comments, and coding style.
